

Financial Sales Dashboard

Financial Analysis Report — Sales Performance & Profit Insights

• Project Overview

This one started with a plain sales sheet - rows and rows of transactions, nothing you'd want to read through by hand. I pulled it into Excel first, cleaned up the messy bits (duplicate entries, missing values, that sort of thing), and then brought it into Power BI to actually build something usable out of it. What came out the other side is a dashboard where you can see total sales, which countries are pulling their weight, which products are actually profitable, and how things have moved month by month. It's the kind of thing that would've taken forever to figure out from the raw file, but takes a few seconds once it's on screen.

• Objective

Honestly, the goal was simple - stop making people scroll through spreadsheets to answer basic questions like "how are we doing this month" or "which country is lagging behind." With the dashboard, that answer is right there. You can check sales, profit, and units sold in one glance, compare countries side by side, and catch a dip in the trend before it becomes a bigger problem. It's less about fancy analytics and more about just making the numbers easy to act on.

• Tools Used

Microsoft Power BI

Used to build the actual dashboard - visuals, KPI cards, and the country slicer

Microsoft Excel

Where the raw sales data got cleaned up before it went anywhere near Power BI

• Dashboard Features

	Total Sales KPI — the top-line revenue number, front and center
	Total Profit KPI — what's actually left after costs
	Total Units Sold KPI — how much product actually moved
	Sales by Country — who's buying the most, at a glance
	Profit by Product — which products are actually worth pushing
	Monthly Sales Trend — the month-to-month rise and fall
	Interactive Country Slicer — click a country, everything updates

• Business Insights

 118.73M TOTAL SALES	 16.89M TOTAL PROFIT	 1.13M UNITS SOLD
--	--	---

- ✓ Out of every country in the data, the **United States** came out on top by a clear margin.
- ✓ The monthly trend line isn't great news, though - sales have been **slipping month over month**, which is worth flagging to the team.
- ✓ Because everything's in one place now, tracking performance across products and regions doesn't need a separate report every time.
- ✓ The bigger win here is just **speed** - decisions that used to need a data pull now just need a look at the screen.

• Conclusion

At the end of the day, what this project really shows is how much a bit of structure can change the way you read data. The same numbers that were sitting quietly in a spreadsheet now tell a much clearer story - the US leading the pack, profit holding up decently, but sales cooling off month by month. None of that would've jumped out from raw rows and columns. Whether it's a manager checking in on performance or someone deciding where to focus next quarter, this dashboard gives them something to actually work with, instead of a pile of numbers to figure out on their own.

• Report Summary

Project Type	Power BI Financial Sales Dashboard
Data Sources	Sales transactions, product profit data, country-level records
Key Metrics	Total Sales (118.73M), Total Profit (16.89M), Units Sold (1.13M)
Top Market	United States
Trend Observed	Decreasing monthly sales trend
